Razem 74 eksperymenty (EVN i RA)

Do zapisu obserwacji RadioAstronu dedykowany jest dyspak

TR-00002/1600

montowany w banku A. Gdyby ten się zappełnił, trzeba użyć innego paka zamontowanego w banku B obok **TR-00002/1600** (lub samego w A). Jeśli zaczęto w banku B, kolejne eksperymenty trzeba nagrywać także w B.

UWAGA: 1-godzinne eksperymenty RA zwykle wymagają ok. 110 GB wolnego miejsca na dyspaku (dłuższe odpowiednio więcej).

A per-experiment summary for the February/March EVN observations

Experiments are listed alphabetically.

- EA053A-E — C-band observations of 5 BL Lac objects with very hard TeV spectra. A general question for such hard spectra is the origin of the lower-energy photons that can get inverse-Compton boosted from collisions with the relativistic electrons in the jet: whether arising from the AGN itself is sufficient or whether a background source of (IR) photons is required. A "self-contained" reservoir of lower energy photons should result in un-limb-brightened structure and the existence of superluminal motion in jet components. These initial observations would seek these characteristics (for the latter, whether there are suitable components to use for tracing the jet kinematics).
- EF025 — L-band observations of 4 hot dust-obscured galaxies that may represent the short phase during galaxy merging & evolution with a transition between starburst- to AGN-dominated domains. These targets have known mJy level radio emission, but have not been observed with VLBI. These observations would seek genuinely young AGN embedded at the cores of the galaxies (CSO-like objects, confined core-jets, possibly even binary AGN).
- EG062E,F — Phase-referencing astrometry of two binary-star systems, each having a low-mass, pre-main-sequence member. By following the orbital motion in the binaries, the dynamical masses can be determined. Coupling with the distance from parallax measurements provides calibration points for stellar evolution models. The two parts observe different targets; multiple epochs (every other session) would follow if the stars are detected.
- EG080A,B — Dual-frequency (L,C) observations of the brightest cluster galaxy in RBS 797 (redshift = 0.35), which shows a possible 90-degree misalignment between jets on different VLA scales. Previous short e-EVN observations showed two compact components separated by 77pc. These new EVN observations would aim to determine whether these components are both cores of a binary AGN or a single core-jet structure.
- EH028B — Using 1612MHz OH masers to get the parallax distance of an OH/IR star, which could be compared also has a distance estimate using the phase-lag method (from the delay between the observed maxima of the light curves on the front and back edges of the shell [i.e., the blue- and red-ends of the velocity-distribution of the maser emission] and the angular diameter of the shell). First of four epochs.
- EM110 — This follows up on the two epochs of EM080 (sess. 1/10, 1/11). The target is a pulsar, around which VLA observations have revealed a pulsar-wind nebula. Cherenkov telescopes have also shown there to be a co-located TeV source. The previous EVN observations greatly refined the proper motion of the pulsar, given the previous VLA data, in relation to the pulsar-wind nebula; these new EVN observations extending the time-baseline by 3 years would enable tracing the pulsar's trajectory on scales larger than the nebula and explore its relation with the TeV source on time-scales longer than 20 kyear.
- EM111 — Previous L-band EVN observations of the gamma-ray binary HESS J0632+057 (RR005, RM006; Feb, Mar'11) caught the source during and just after the phase of main X-ray outburst (period 315 days). The derived EVN fluxes follow the decay of the X-ray light curve better than do GMRT at 1.3 GHz, suggesting the presence of a diffuse component

that VLBI can resolve out. These observations are timed to observe just after the secondary X-ray peak, which would help constrain the geometry of the shock arising from the interaction between the winds of the compact object and the primary star forming the binary.

EP088C,D — multi-frequency (L,C) imaging of a sample of luminous infra-red galaxies, made in conjunction with an e-MERLIN legacy project on the same targets. There are dozens of targets, being addressed a few at a time over several sessions (each with L- and C-band obs). Goals include separating contributions from AGN and starbursts to the overall energy budget, and detecting individual supernovae and/or supernova remnants.

ES071A — Methanol maser spectral-line observations to a nearby massive star-forming region in Orion to obtain the velocity field structure traced by the masers in what appears to be circum-stellar disk. Inclusion of cross-pol correlation will also allow characterizing the magnetic field structure. The second of 3 annual epochs.

ES072E-G — Continuing a survey of polarization in methanol masers around massive proto-stars, which would provide the means to determine the direction of the stellar magnetic field and, with laboratory measurements being worked on separately, also the magnetic-field strength. It is still not well known exactly how the magnetic field influences massive-star formation.

EV019A,B — Dual-frequency (L,C) observations of the luminous infra-red galaxy NGC4418, in order to distinguish contributions of young, compact star-burst and dust-enshrouded AGN to the overall radio emission.

GA030D — EVN+RadioAstron observations of 3C279, targeting the innermost jet region with full-Stokes correlation to address the magnetic-field structure unprecedentedly close to the central engine and jet-launch region. GA030 has 5 targets in all; previous epochs have been observed in out-of-session EVN+RadioAstron segments.

GA032A — A preliminary short e-EVN phase-reference candidate search associated with a global proposal to study the rotations of the jet position angle of NRAO 150 at Q-band.

GP053A — C-band EVN-only observations continuing (e.g., EP075A-H, EP087A-E) to monitor the compact sources in Arp299, a merging galaxy system (i.e., merging drives lots of massive star formation leading to supernovae; there is also the signature of an AGN in one of the nuclei). This is part of a global multi-frequency proposal; global epochs will follow.

SOURCES USED IN RECORDING SCANS -- 6.7GHz CH3OH maser polarization towards massive protostars. II.

Catalog positions marked with *.

Precession of date coordinates is based on stop time of first scan.

Names used in schedule marked with *.

Short names used in VLA and SNAP files marked with +.

Observation date used in B1950/J2000 coordinate conversion (PRECDATE): 1979.900

No adjustments are made for rates (DRA, DDEC).

Scan hours are for recording scans only.

Baseline hours are only counted for scans above horizon at both ends.

The solar corona can cause unstable phases for sources too close to the Sun.

SCHED provides warnings at individual scans for distances less than 10 degrees.

The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
G23.44-0.18	62.6
J1331+3030	135.5
J2136+0041	19.6
J2202+4216	51.0

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

Notes: 5cm NME and ftp fringe test for session 1/2014
(128 Mbps, L+R, 2-bit sampling, 2 MHz filters)
Please send the disk pack by express to JIVE

COVER LETTER:

This is the schedule for the 5cm NME and ftp fringe-test on 01 March 2014 involving 9 antennas: Eb Wb1 Jb2 On25 Mc Nt Tr Sh Ys Sr (Td, Yd, Md). The NME uses a standard setup with 128 Mbps.

The schedule consists of:

- long integrations on strong calibrators like 3C48, DA193 for ftp-fringe tests;
- linear polarization check using the polarized calibrator J2202+4216 (3C48 as calibrator of J2202+4216);
- D-terms check using the calibrator DA193;
- and phase-referencing parts with a continuum source (J0552+3754) as target.

Three ftp-fringe tests are scheduled throughout the experiment:

12:39:58 (scan 2, 2 sec, 3C48)
13:49:58 (scan 22, 2 sec, DA193)
14:46:58 (scan 60, 2 sec, DA193)

Please make sure that the autoftp is set up correctly. Thanks!

Good luck with the session!

Gabriele

 Catalog positions marked with *.
 Precession of date coordinates is based on stop time of first scan.
 Names used in schedule marked with *.
 Short names used in VLA and SNAP files marked with +.
 Observation date used in B1950/J2000 coordinate conversion (PRECDATE): 1979.900
 No adjustments are made for rates (DRA, DDEC).
 Scan hours are for recording scans only.
 Baseline hours are only counted for scans above horizon at both ends.

The solar corona can cause unstable phases for sources too close to the Sun.
 SCHED provides warnings at individual scans for distances less than 10 degrees.
 The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
3C48	57.1
J0552+3754	107.1
DA193	107.6
J2202+4216	50.9

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

SOURCES USED IN RECORDING SCANS -- 6.7GHz CH30H maser polarization towards massive protostars. II.
 Catalog positions marked with *. Precession of date coordinates is based on stop time
 of first scan. Names used in schedule marked with *. Short names used in VLA and SNAP files
 marked with +. Observation date used in B1950/J2000 coordinate conversion (PRECDATE): 1979.900
 No adjustments are made for rates (DRA, DDEC). Scan hours are for recording scans only.
 Baseline hours are only counted for scans above horizon at both ends.

The solar corona can cause unstable phases for sources too close to the Sun.
 SCHED provides warnings at individual scans for distances less than 10 degrees.
 The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
G25.83-0.18	62.6
J1331+3030	136.1
J2136+0041	20.3
J2202+4216	50.8

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes
 that the Sun will cause amplitude reductions on the longest VLBA baselines
 at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

1.6 GHz	45. deg	8.4 GHz	17. deg
2.3 GHz	36. deg	15.0 GHz	12. deg
5.0 GHz	23. deg	22.0 GHz	9. deg

The solar corona can cause unstable phases for sources too close to the Sun.
SCHED provides warnings at individual scans for distances less than 10 degrees.
The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
G25.71+0.04	63.8
J1331+3030	136.6
J2136+0041	21.0
J2202+4216	50.6

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

1.6 GHz	45. deg	8.4 GHz	17. deg
2.3 GHz	36. deg	15.0 GHz	12. deg
5.0 GHz	23. deg	22.0 GHz	9. deg

Phone: +31-521-596548 EMAIL: goddi@jive.nl
Phone during observation: +31-521-596548

Notes: 6cm FTP Fringe Test for Session 1/2014
 512 Mbps, L+R, 2-bit sampling, 8 MHz filters
 Please send the disk pack by express to JIVE

COVER LETTER:

This is the schedule for the 6cm ftp fringe-test F14C1 on 03 March 2014 involving 16 antennas: Ef Wb Jb1 On25 Mc Nt Tr Sv Zc Bd Ur Sh Sh65 Hh Ys Ir. Stations testing their new DBBC backends are also included: MC_DBBC (Md), TR_DBBC (Td), and YS_DBBC (Yd). The ftp test uses a standard 512 Mbps setup and consists of long integrations on standard fringe finder calibrators: 0528+134 (2 Jy at 5 GHz) and DA193 (5 Jy at 5 GHz).

There are two ftp fringe-test scans

- (1) 16:09:00 UT (scan 2, 2 sec, 0528+134)
- (2) 16:45:00 UT (scan 6, 2 sec, DA193)

Please make sure that the autoftp is set up correctly.

See you on Skype group chat
and
Good luck with the session!

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
0150+015	44.0
0158+031	46.2
0234+285	63.2

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

Notes: 6cm NME + FTP FT for session 1/2014
 512 Mbps, 2-bit sampling, 8 MHz filters
 Participation from Sr (with DBBC), and Sh65 (TIANMA65 or T6) expected
 Additional DBBC testing data from Mc, Tr, and Ys is also expected.

COVER LETTER:

Dear EVN friends,

This is the schedule for the 1.3cm FTP-FT on March 04 2014, involving 19 stations: Eb Wb Jb1 On25 Mc Nt Tr Sv Zc Bd Ir Ur Sh Hh Ys, as well as Md Td Yd (Mc Tr and Ys with DBBC) and Sh65. The session uses a standard setup with 512 Mbps and consists of three ftp fringe tests, interspersed with a longer set of phase referencing scans on 3C 84 (~25 Jy source at 5 GHz), and a weaker calibrator.

The three ftp fringe-test scans, start at:

- (1) 14:07:30 UT (scan 2, 2 sec)
- (2) 14:57:20 UT (scan 20, 2 sec)
- (3) 16:52:50 UT (scan 62, 2 sec)

See you on Skype group chat
and
Good luck with the session!

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
FAKERA	101.2
ORION_H20	98.0
0605-085	105.6

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
ARP299	127.4
J1128+5925	126.6
4C39.25	141.0

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg	8.4 GHz	17. deg
610 MHz	81. deg	15.0 GHz	12. deg
1.6 GHz	45. deg	22.0 GHz	9. deg
2.3 GHz	36. deg	43.0 GHz	6. deg
5.0 GHz	23. deg

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
HD-MID	91.1
J1746+6226	90.4
1803+784	93.1
3C454.3	22.4

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
0706+592	110.9
0738+548	116.8

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
1218+304	149.8
1226+373	143.4
3C345	98.0

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
EKDRA	110.4
3C286	137.9
J1441+6318	110.7
NRA0512	98.6
3C454.3	22.1

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
0414+009	77.5
0422+004	79.4
0528+134	97.0

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
NGC4418	159.5
J1232	157.8
J1256	151.0

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
1101-232	151.6
1045-188	155.2
1127-145	160.2

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
RBS797	106.8
J0954+7435	108.6
3C345	99.9

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

327 MHz	117. deg
610 MHz	81. deg
1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg
22.0 GHz	9. deg
43.0 GHz	6. deg

Notes: 1.3cm FTP Fringe Test for session 1/2014
1024 Mbps, 2-bit sampling, 16 MHz filters
Participation from Sr (with DBBC), and Sh65 (TIANMA65 or T6) expected
Additional DBBC testing data from Mc, Tr, and Ys is also expected.

COVER LETTER:

Dear EVN friends,

This is the schedule for the 1.3cm FTP-FT on March 10 2011,
involving 22 stations: Eb Jb2 On20 Mc Nt Tr Sv Zc Bd Ur Sh Hh Ys
Mh Sr Ky, Ku, Kt, as well as Md Td Yd (Mc Tr and Ys with DBBC)
and Sh65. The test uses a standard setup with 1024 Mbps and consists
of two ftp fringe tests, interspersed with a longer set of scans on
0234+285 (~1.5 Jy source at 22 GHz).

The two ftp fringe-test scans, start at:

- (1) 12:07:30 UT (scan 2, 2 sec)
- (2) 12:56:00 UT (scan 8, 2 sec)

See you on Skype group chat
and
Good luck with the session!

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun.
SCHED provides warnings at individual scans for distances less than 10 degrees.
The distance from the Sun to each source in this schedule is:

Notes: 1.3 cm NME for session 1/2014
 1 Gbps, 2-bit sampling, 16 MHz filters
 Send the disk pack by express to JIVE

COVER LETTER:

Dear EVN friends,

This is the schedule for the 1.3cm NME on March 11 2014,
involving 16 EVN antennas: Eb Jb2 On20 Mc Nt Tr Sv Zc Bd Ur Sh Sh65 Hh Ys Mh Sr,
plus the KVN stations KVNYS KVNUS KVNTN.

Stations testing their new DBBC backends are also included:
MC_DBBC (Md), TR_DBBC (Td), and YS_DBBC (Yd).

The NME uses a setup with 1 Gbps and consists of
integrations on the VLBI fringe finder DA193 (~1.8Jy at 22 GHz)
as well as phase-referencing cycles between continuum calibrators
(1st phase-reference cycle: J2040+4527 -- J2039+4159;
2nd phase-reference cycle: DA193 -- J0605+4030).

There are three ftp fringe-test scans

- (1) 14:09:00 UT (scan 2, 2 sec, DA193)
- (2) 15:31:00 UT (scan 38, 2 sec, DA193)
- (3) 16:29:00 UT (scan 69, 2 sec, DA193)

See you on Skype group chat
and
Good luck with the session!

SOURCES USED IN RECORDING SCANS -- Network Monitoring Experiment

Catalog positions marked with *.

Precession of date coordinates is based on stop time of first scan.

Names used in schedule marked with *.

Short names used in VLA and SNAP files marked with +.

Observation date used in B1950/J2000 coordinate conversion (PRECDATE): 1979.900

No adjustments are made for rates (DRA, DDEC).

Scan hours are for recording scans only.

Baseline hours are only counted for scans above horizon at both ends.

The solar corona can cause unstable phases for sources too close to the Sun.
 SCHED provides warnings at individual scans for distances less than 10 degrees.
 The distance from the Sun to each source in this schedule is:

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
0648-165	107.3

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
0754+100	123.5

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

1.6 GHz	45. deg
2.3 GHz	36. deg
5.0 GHz	23. deg
8.4 GHz	17. deg
15.0 GHz	12. deg

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

```

Source      Sun distance (deg)
0805-077    124.2

```

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

```

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
0642+449	98.2

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

```

Source      Sun distance (deg)
0805-077    119.2

```

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

EFFECT OF SOLAR CORONA

The solar corona can cause unstable phases for sources too close to the Sun. SCHED provides warnings at individual scans for distances less than 10 degrees. The distance from the Sun to each source in this schedule is:

Source	Sun distance (deg)
1022+707	104.5
SN2014J	103.7

Barry Clark estimates from predictions by Ketan Desai of IPM scattering sizes that the Sun will cause amplitude reductions on the longest VLBA baselines at a solar distance of $60 \text{ deg } F^{-0.6}$ where F is in GHz.

For common VLBI bands, this is:
